

Single Stage Pre-Filtration Sediment Filter (Big Blue Filter)

Sediment Filter for Heavy Sediment and Particulates (Dirt, Rust, Sand, Silt).

20" Big Blue Housing for use on 3/4" to 1" lines. Includes superior 5-micron, 20" pure polypropylene filter for full bed depth.

These units are designed to provide pre-filtration of heavier sediment and/or particulate (dirt, rust – not iron, sand, silt) at point of entry prior to a carbon-based filtration appliance or after an iron removal unit. This is a sediment filtration system and will not filter chlorine or any other VOCs, nor is it meant to filter iron, manganese, odors or discoloration.

- Made in the USA.
- Maintenance-free for up to 1 year before filter replacement (filter life depends on severity of sediment).

Hassle-Free. Replacing filters is easy – use the included “spanner wrench” to spin housings off and on. Reduces particulate material and debris in order to protect your home and other treatment systems. Safe for people, pets, and plants.
